Morning Josh, hope you had a great weekend. Looks like you haven't completely finish Lab 7, so feel free to ask me any questions in class or over text. In general, the code you do have looks to be following good rules of organization and tidiness. The only problem you seem to be having is your function writing. Remember the summarize missing data task should use a summarize function across column with YOUR defined function for finding NAs. Also it's always personal preference, but if were you I'd completely stick to using |> for all code you can. For example, the ggplots in Task 4 manually have blackfoot input as data. Overall great work.
